

**3<sup>rd</sup> call for papers – registration deadline extended until April 3<sup>rd</sup>**

we'd like to point your attention to the **symposium of the International Commission on Continental Erosion (ICCE)** of the IAHS that we're proud to host at the Catholic University of Eichstätt-Ingolstadt, Germany, on **July 24th-26th, 2024**.

As the anthropogenic alteration of global climate and its specific regional features become more and more evident, the symposium aims to shed light on recent progress and research avenues regarding the **sensitivity of erosion and sediment transport to recent climatic and environmental changes**. This topic spans multiple compartments of geosystems such as

- processes on hillslopes and slope stability
- fluvial processes, river planform changes and sediment budgets
- aeolian sediment dynamics

Consequently, we're open for contributions related to different environments of the Earth and hope to stimulate discussion and collaboration. As many of the aforementioned processes affect human life, societies and economy, we are interested in both basic and applied research. Your presentation might also show methodological innovations leading to better measurements and understanding of erosion and sediment transport in the past, present and future.

The [venue](#) is located in central Bavaria, between Munich and Nuremberg (airports) and can be reached by national and international train connections. We offer a post-conference field trip to one of our study areas in the Bavarian Alps (April 26<sup>th</sup>). Please visit our [conference website](#), get informed, and consider registering for this international yet familiar event !

On behalf of the [organisers](#)
